Chemokines are a family of small secreted proteins that are involved in cell migration and inflammation. They are classified into several groups based on their structure and function. The most common group is the CXC group, which is characterized by the presence of two conserved cysteine residues that form a disulfide bridge. Other groups include CC, CX3C, and XC.

Chemokines are secreted by various cells, including macrophages, T cells, and endothelial cells. They act on target cells by binding to specific receptors, leading to the activation of signaling pathways that result in cell migration and chemotaxis. Chemokines also play a role in the recruitment of immune cells to sites of infection and inflammation.

Chemokines are involved in a wide range of biological processes, including embryonic development, hematopoiesis, and the immune response. They are also implicated in various diseases, including cancer, HIV, and multiple sclerosis.

Chemokines are secreted as inactive precursors and are activated by proteolytic cleavage. The active chemokines are then secreted and bind to their receptors on target cells. The binding of chemokines to their receptors leads to the activation of signaling pathways that result in cell migration and chemotaxis.

Chemokines are involved in the recruitment of immune cells to sites of infection and inflammation. They are also involved in the regulation of the immune response, including the activation of T cells and the production of antibodies.
